Agda

- Agda is a theorem prover based on Martin-Löf's intuitionistic type theory.
- Proofs and programs are treated the same:

$$n : \mathbb{N}$$

$$n = \exp 5 20$$

$$p : A \land B$$

$$p = \langle \cdots, \cdots \rangle$$

- ► Programs and proofs are defined recursively.
- In order to obtain soundness, elements of proofs need to be terminating. Otherwise we could prove falsity:

```
p: \perp
p = p
```

Termination of programs guaranteed by a termination checker based on strongly extended primitive recursion.

Framework of Agda

- ► For historic reasons types denoted by keyword Set.
- 3 main constructs:
 - dependent function types,
 - algebraic data types,
 - coalgebraic data types.

э

< 日 > < 同 > < 三 > < 三 >

Dependent Function Types and ∀-Quantifier

Dependent function type

$$(x:A) \rightarrow B$$

is type of functions mapping a : A to an element of type B[x := a].▶ E.g.

 $\text{matmult}: (n \ m \ k : \mathbb{N}) \to \text{Mat} \ n \ m \to \text{Mat} \ m \ k \to \text{Mat} \ n \ k \\ \text{matmult} \ n \ m \ k \ A \ B = \cdots$

► Main example of dependent function type is ∀-quantifier:

$$(x:A) \to \varphi$$

is type of functions mapping x : A to a proof of φ , i.e. type of proofs of $\forall x.\varphi$. So $(x : A) \rightarrow \varphi$ stands for $\forall x.\varphi$.

Algebraic data types

data \mathbb{N} : Set $0 : \mathbb{N}$ suc : $\mathbb{N} \to \mathbb{N}$

Functions defined by pattern matching

$$f: \mathbb{N} \to \mathbb{N}$$

$$f \qquad 0 = 5$$

$$f \qquad (\operatorname{suc} 0) = 12$$

$$f (\operatorname{suc} (\operatorname{suc} n)) = (f n) * n$$

Equality

Equality type is algebraic type indexed over pairs of elements of set A There is on proof refl : x == x.

data _ == _ {X : Set} :
$$X \to X \to$$
 Set where
refl : { $x : X$ } $\to x == x$

transferEq :
$$(X : Set)$$

 $\rightarrow (Y : X \rightarrow Set)$
 $\rightarrow (x : X)$
 $\rightarrow (y : X)$
 $\rightarrow (x == y)$
 $\rightarrow Y x$
 $\rightarrow Y y$
transferEq $X Y \times x$ refl $y = y$

3

ヘロト 人間ト ヘヨト ヘヨト

Coalgebraic data types

Syntax as AS would like it to be:

inc : $\mathbb{N} \to \text{Stream}$ head (inc n) = ntail (inc n) = inc (n + 1)

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

Syntax in Agda

Agda allows hidden arguments

```
cons : \{X : Set\} \to X \to List X \to List Xl : List \mathbb{N}l = cons 0 nil
```

No deep theory behind – anything is legal as long as the theorem prover can determine a unique solution to hidden arguments.

Agda has mixfix symbols.
 Syntax example if_then_else_
 Again: anything is allowed as ler

Again: anything is allowed as long as the parser can parse it uniquely.

Postulated functions (functions without a definition)

postulate false : \perp

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ● ● ● ● ● ● ●

Dependent Product

One example of an algebraic data type:

data
$$\exists$$
 (*A* : *Set*) (φ : *A* \rightarrow Set) : Set
 $\langle _, _ \rangle$: (*a* : *A*) $\rightarrow \varphi$ *a* $\rightarrow \exists$ *A* φ

Projections

$$\pi_{0} : \{A : \text{Set}\} \to \{\varphi : A \to \text{Set}\} \to \exists A \varphi \to A$$
$$\pi_{0} \langle a, b \rangle = a$$

$$\pi_{1}: \{A: \operatorname{Set}\} \to \{\varphi: A \to \operatorname{Set}\} \to (x: \exists A \varphi) \to \varphi (\pi_{0} x)$$

$$\pi_{1} \langle a, b \rangle = b$$

Question by Ulrich Berger

- Can you extract programs from proofs in Agda?
- Obvious because of Axiom of Choice?
 From

$$p:(x:A) \to \exists B \varphi$$

we get of course

$$f = \lambda x.\pi_0 (p x) : A \to B$$

$$q = \lambda x.\pi_1 (p x) : (x : A) \to \varphi (f x)$$

However what happens in the presence of axioms?

・ロト ・同ト ・ヨト ・ヨト

Real Numbers as Ideal Objects

- Situation different in presence of axioms.
- Approach of Ulrich Berger transferred to Agda: Axiomatice the real numbers abstractly. E.g.

postulate	\mathbb{R}	:	Set
postulate	_ + _	:	$\mathbb{R} \to \mathbb{R} \to \mathbb{R}$
postulate	$\operatorname{commutative}$:	$(r \ s : \mathbb{R}) \rightarrow r + s == s + r$

< 日 > < 同 > < 三 > < 三 >

2. Real Number Computations in Agda

. . .

. . .

Computational Numbers as Concrete Objects

▶ Formulate \mathbb{N} , \mathbb{Z} , \mathbb{Q} as usual

data \mathbb{N} : Set where $0 \quad : \quad \mathbb{N}$ suc $: \quad \mathbb{N} \to \mathbb{N}$

$$\begin{array}{rcl} -+ & \vdots & \mathbb{N} \to \mathbb{N} \\ n & + & 0 & = & n \\ n & + & \mathrm{suc} & m & = & \mathrm{suc} & (n+m) \end{array}$$

 $_{-}*_{-}:\mathbb{N}\to\mathbb{N}\to\mathbb{N}$

data \mathbb{Z} : Set where

data $\mathbb Q: \operatorname{Set}$ where

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Embedding of \mathbb{N} , \mathbb{Z} , \mathbb{Q} into \mathbb{R}

$$N2\mathbb{R}: \mathbb{N} \to \mathbb{R}$$

$$N2\mathbb{R} \quad 0 = 0_{\mathbb{R}}$$

$$N2\mathbb{R} \quad (suc \ n) = N2\mathbb{R} \ n +_{\mathbb{R}} 1_{\mathbb{R}}$$

$$\mathbb{Z}2\mathbb{R}: \mathbb{Z} \to \mathbb{R}$$
...
$$Q2\mathbb{R}: \mathbb{Q} \to \mathbb{R}$$
...

► We obtain a link between computational types N, Z, Q and the postulated type R.

Anton Setzer

Cauchy Reals

data CauchyReal
$$(r : \mathbb{R})$$
: Set where
cauchyReal : $(f : \mathbb{N} \to \mathbb{Q})$
 $\to (p : (n : \mathbb{N}) \to |\mathbb{Q}2\mathbb{R} (f n) -_{\mathbb{R}} r|_{\mathbb{R}} <_{\mathbb{R}} 2_{\mathbb{R}}^{-n})$
 $\to CauchyReal r$

E

▲ロト ▲圖 ト ▲注 ト ▲注 ト

Program Extraction for Cauchy Reals

▶ Show CauchyReal closed under +, *, other operations.

 $\begin{array}{l} \operatorname{lemma}: (r \ s : \mathbb{R}) \to \operatorname{CauchyReal} r \to \operatorname{CauchyReal} s \\ \to \operatorname{CauchyReal} (r * s) \end{array}$

• Using this show p: CauchyReal r for some r.

• E.g. for
$$r = \mathbb{Q}2\mathbb{R} q$$
.

Define

 $f:(r:\mathbb{R}) \to (p: \mathrm{CauchyReal}\; r) \to \mathbb{N} \to \mathbb{Q}$

which extracts the Cauchy sequence in p.

▶ If we have $r : \mathbb{R}$; p : CauchyReal r; $n : \mathbb{N}$ then

 $f r p n : \mathbb{Q}$

is an approximation of r up to 2^{-n} . Can be computed in Agda.

Problem of Program Extraction

- ▶ Problem is that definition of *f* was referring to postulated axioms.
- ► So we might obtain

f r p n =lemma35 (lemma16 3) 5

▶ We want that even though we use postulated axioms *f r p n* reduces to a computational real number, i.e. (1/2).

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

Signed Digit Representations

- We can consider as well the real numbers with signed digit representations.
- \blacktriangleright Signed digit representable real numbers in [-1,1] are of the form

$$0.111(-1)0(-1)01(-1)\cdots$$

In general

 $0.d_0d_1d_2d_3\cdots$

where $d_i \in \{-1, 0, 1\}$.

Signed digit needed because even the first digit of an unsigned digit representation can in general not be determined.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三日 - つへつ

2. Real Number Computations in Agda

Coalgebraic Definition of Signed Digit Real Numbers (SD)

data Digit : Set where $-1_d \ 0_d \ 1_d$: Digit

э

イロト イヨト イヨト

Proof of " $1_{\mathbb{R}} = 0.1_d 1_d 1_d 1_d \cdots$ "

$$\begin{array}{ll} 1_{\mathrm{SD}} : (r : \mathbb{R}) \to (r ==_{\mathbb{R}} 1_{\mathbb{R}}) \to \mathrm{SD} \ r \\ \in [-1, 1] & (1_{\mathrm{SD}} \ r \ q) = & \cdots \\ \mathrm{digit} & (1_{\mathrm{SD}} \ r \ q) = & 1_{\mathrm{d}} \\ \mathrm{tail} & (1_{\mathrm{SD}} \ r \ q) = & 1_{\mathrm{SD}} \left(2_{\mathbb{R}} \ast_{\mathbb{R}} r -_{\mathbb{R}} 1_{\mathbb{R}} \right) \cdots \end{array}$$

Proofs of $\cdots\,$ can be

- ► inferred purely logically from axioms about R (using automated theorem proving?)
- added as postulated axioms.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ● ●

2. Real Number Computations in Agda

Proof of " $0_{\mathbb{R}} = 0.(-1_{\mathrm{d}})1_{\mathrm{d}}1_{\mathrm{d}}1_{\mathrm{d}}\cdots$ "

$$\begin{array}{lll} 0_{\mathrm{SD}} : (r : \mathbb{R}) \to (r ==_{\mathbb{R}} 0_{\mathbb{R}}) \to \mathrm{SD} \ r \\ \in [-1, 1] & (0_{\mathrm{SD}} \ r \ q) &= & \cdots \\ \mathrm{digit} & (0_{\mathrm{SD}} \ r \ q) &= & -1_{\mathrm{d}} \\ \mathrm{tail} & (0_{\mathrm{SD}} \ r \ q)) &= & 1_{\mathrm{SD}} \left(2_{\mathbb{R}} \ast_{\mathbb{R}} r -_{\mathbb{R}} \left(-1_{\mathbb{R}} \right) \right) & \cdots \end{array}$$

Extraction of Programs

From

$p: \mathrm{SD} \ r$

one can extract the first n digits of r.

- ▶ Show e.g. closure of SD under $\mathbb{Q} \cap [-1,1]$, $+ \cap [-1,1]$, *, $\frac{\pi}{10} \cdots$
- Then we extract the first n digits of any real number formed using these operations.
- Has been done (excluding $\frac{\pi}{10}$) in Agda.

Conclusion

イロト イポト イヨト イヨト

Problem with Program Extraction

- Because of postulates it is not guaranteed that each program reduces to canonical head normal form.
- ► Example 1

postulate ax : $(x : A) \rightarrow B[x] \lor C[x]$

a : A a = · · ·

 $f: B[a] \lor C[a] \to \mathbb{B}$ f (inl x) = tt f (inr x) = ff

f(ax a) in Normal form, doesn't start with a constructor

► Axioms with computational content should not be allowed.

3

postulate ax : $A \land B$ $f : A \rightarrow B \rightarrow \mathbb{B}$ $f a b = \cdots$ $g : A \land B \rightarrow \mathbb{B}$ g (p a b) = f a b

 $g \, \mathrm{ax}$ in normal form doesn't start with a constructor

- Problem actually occurred.
- Axioms with result type algebraic data types are not allowed.

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

3. Theory of Program Extraction

Example 3

$$egin{aligned} r0 &: \mathbb{R} \ r0 &= 1_{\mathbb{R}} \ r1 &: \mathbb{R} \ r1 &= 1_{\mathbb{R}} +_{\mathbb{R}} 0_{\mathbb{R}} \end{aligned}$$

postulate ax : r0 == r1

2

postulate ax : r0 == r1

transfer :
$$(r \ s : \mathbb{R}) \to r == s \to SD \ r \to SD \ s$$

transfer $r \ r$ refl $p = p$

$$f:(r:\mathbb{R})\to \mathrm{SD}\ r\to \mathrm{Digit}$$
$$f\ r\ a=\cdots$$

$$p: SD r_0$$
$$p = \cdots$$

$$\begin{array}{l} q: \mathrm{SD} \ r_1 \\ q = \mathrm{transfer} \ r_0 \ r_1 \ \mathrm{ax} \ p \end{array}$$

$$q'$$
: Digit
 $q' = f r_1 q$

NF of q' doesn't start with a constructor

Problem actually occurred.

3. Theory of Program Extraction

Work around Problem of Equality

Instead of defining

 $p: SD r_0$

define

$$p:(r:\mathbb{R}) \to (r=r_0) \to \mathrm{SD}\ r$$

Conditions for Correctness

We will define conditions which guarantee that every closed term in normal form which is an element of an algebraic data type is in canonical normal form (starts with a constructor).

・ロト ・同ト ・ヨト ・ヨト

General Assumptions about Agda Code

- Agda code is **strongly normalising**.
- Agda code is **confluent**.
- ► No occurrence of record types, let- and where-expressions.
- Apart from the identity type, all algebraic data types are non-indexed and we have no inductive-recursive definitions.
- ► No coalgebraic types (work in progress to include them).
- Functions defined in Agda by pattern matching have
 - a coverage complete pattern matching (all cases provided)
 - all patterns are disjoint.

イロト イポト イヨト イヨト

General Assumptions about Agda Code

- Agda code is consistent, i.e.:
 - If Agda proves A = B : Set then
 - if one is algebraic data type the other one is algebraic data type with same definition (up to equality)
 - if one is of the form $(x : B) \rightarrow C$ so is the other with equal types
 - If t : C t₁ · · · t_n : B where B is algebraic, then C is a constructor of B and t_i are of appropriate types.
 - If $C t_1 \cdots t_n = C' t_1 \cdots t'_m$ then C = C', n = m, $t_i = t'_i$.

Main Restriction on Agda Code

- If A is a postulated constant then either
 - $A: (x_1:B_1) \rightarrow \cdots \rightarrow (x_n:B_n) \rightarrow \text{Set or}$
 - A: (x₁: B₁) → · · · → (x_n: B_n) → A' t₁ · · · t_n where A' is a postulated constant or an equality.
- ► The same applies to functions *f* defined by case distinction on equalities.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

Main Theorem

Theorem (Main Theorem)

- Assume the above conditions.
- Then every closed term in normal form which is an element of an algebraic data type is in canonical normal form (starts with a constructor).

э

・ロト ・同ト ・ヨト ・ヨト

Proof Assuming Simple Pattern Matching

- ► Assume *t* : *A*, *t* closed in normal form, *A* algebraic data type.
- Show by induction on length(t) that t starts with a constructor:
 - We have

$$t = f t_1 \cdots t_n$$

where f function symbol or constructor.

- *f* cannot be postulated or directly defined.
- ► *f* cannot be defined by case distinction on an equality.
- ▶ If *f* is defined by pattern matching on an algebraic data type say *t_i*.
 - By IH *t_i* starts with a constructor.
 - t has a reduction, wasn't in NF.
- ► So *f* is a constructor.

イロト イポト イヨト イヨト

Properties of Agda Code

- Agda code has the normal form property if every closed normal term which is an element of an algebraic data type starts with a constructor.
- ► Agda code $\underline{\mathcal{A}}'$ extends Agda code $\underline{\mathcal{A}}$ $(\underline{\mathcal{A}} \subseteq \underline{\mathcal{A}}')$

if all judgements derivable in ${\mathcal A}$ are derivable in ${\mathcal A}'$ as well.

- ► Assume $\mathcal{A} \subseteq \mathcal{A}'$. \mathcal{A}' induces the head normal form property on \mathcal{A} if
 - whenever B is an algebraic data type
 - ▶ s.t. $\mathcal{A} \vdash t : B$
 - and t has in \mathcal{A}' a normal form starting with a constructor,
 - then t has in A a normal form starting with the same constructor.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三日 - つへつ

Properties of Agda Code

- Assume $\mathcal{A} \subseteq \mathcal{A}'$.
 - A ⊆ A' induces the coverage completeness property, iff: if A is coverage complete with disjoint patterns so is A'.
 - A ⊆ A' induces the strong normalisation property, iff: if A is strongly normalising, so is A'.
 - A ⊆ A' induces the consistency property, iff: if A is consistent, so is A'.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

Theorem (Unnesting of Pattern Matching)

Theorem (Unnesting of Pattern Matching)

- ► Assume A is Agda code fulfilling the above restrictions.
- Then there exists $\mathcal{A} \subseteq \mathcal{A}'$ s.t.
 - A' has simple pattern matching only,
 - $\mathcal{A} \subseteq \mathcal{A}'$ induces the head normal form property,
 - A ⊆ A' induces coverage completeness, strong normalisation and consistency properties.

4. Reduction of Nested to Simple Pattern Matching

Example 2 Reduction to Simple Pattern Matching

Original code:

$$f : \mathbb{N} \to \mathbb{N}$$

$$f \quad 0 = 5$$

$$f \quad (\operatorname{suc} 0) = 12$$

$$f \quad (\operatorname{suc} (\operatorname{suc} n)) = (f \ n) * n$$

Reduct:

mutual

$$f: \mathbb{N} \to \mathbb{N}$$

$$f = 0 = 5$$

$$f \quad (suc n) = g n$$

$$g: \mathbb{N} \to \mathbb{N}$$

$$g = 0 = 12$$

$$g \quad (suc n) = (f n) * n$$

Э

マイビット キャット

Termination of the Reductions

• If \mathcal{A} is Agda code, f a function of \mathcal{A} with pattern matching terms

$$m^{\mathcal{A}}(f) := \begin{cases} 0 & \text{if } f \text{ has simple pattern} \\ \text{sum of length of all patterns of } f & \text{otherwise} \end{cases}$$

 \blacktriangleright Let for Agda code ${\cal A}$

 $m(\mathcal{A}) = \{ |m^{\mathcal{A}}(f) | f \text{ function symbol defined by pattern matching in } \mathcal{A} \}$ where $\{ |\cdots | \}$ denotes a multiset.

4. Reduction of Nested to Simple Pattern Matching

Main Difficulty

Show that each reduction step induces the properties mentioned before.

Э

ヘロト 人間ト ヘヨト ヘヨト

4. Reduction of Nested to Simple Pattern Matching

Proof of Main Theorem

- First reduce Agda code to simple pattern matching using Theorem on Unnesting of Pattern Matching.
- Then use the above proof for Agda code having simple pattern matching.

ヘロト 人間ト ヘヨト ヘヨト

- 1. A short introduction into Agda
- 2. Real Number Computations in Agda
- 3. Theory of Program Extraction
- 4. Reduction of Nested to Simple Pattern Matching
- 5. Extensions
- 6. Applications

Conclusion

- 4 同 1 - 4 回 1 - 4 回 1

Extensions

- \blacktriangleright Negated axioms such as $\neg(0_{\mathbb{R}} == 1_{\mathbb{R}})$ are currently forbidden
 - \blacktriangleright Have form $0_{\mathbb{R}} == 1_{\mathbb{R}} \to \bot$ where \bot is algebraic data type.
 - Causes problems since they are needed (e.g. when using the reciprocal function).
 - Without negated axioms the theory is trivially consistent (interpret all postulate sets as one element sets).
 - With negated axioms it could be inconsistent.
 - ▶ E.g. take axioms which have consequences $0_{\mathbb{R}} == 1_{\mathbb{R}}$ and $\neg (0_{\mathbb{R}} == 1_{\mathbb{R}}).)$
 - In case of an inconsistency we would get a proof $p : \bot$ and therefore

efq
$$p:\mathbb{N}$$

is non-canonical of \mathbb{N} in NF.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

Theorem (Negated Axioms)

- Assume conditions as before.
- Assume result type of axioms is always a postulated type or a negated postulated type.
- Assume the Agda code doesn't prove \perp .
- Then every closed term which is an element of an algebraic data type is in canonical normal form (starts with a constructor).

< ロ > < 同 > < 回 > < 回 > < 回 > <

More Extensions

- We could separate our algebraic data types into those for which we want to use their computational content and those for which we don't use their content.
- Assume we never derive using case distinction on a non-computational data type an element of a computational data type.
- Then axioms with result type non-computational data types could be allowed, e.g.

tertiumNonDatur :
$$A \lor_{non-computational} \neg A$$

Addition of Coalgebraic Types

- Original proof didn't include coalgebraic types.
- With coalgebraic types additional complication:
 t can be of the form

elim t_1

for an eliminator elim of a coalgebraic type.

- Extend the theorem by proving simultaneously:
 - ► If A algebraic, t closed term in NF, t : A, then t starts with a constructor.
 - ► If A coalgebraic, t closed term, t : A, and elim is an eliminator of A, then elim t has a reduction.

Easy Proofs

- Acclimatised theory allows to easily prove big theorems by postulating them, as long as we are only interested in the computational content.
- In an experiment we introduced axioms such as

$$\mathrm{ax}:(r:\mathbb{R})
ightarrow (q:\mathbb{Q})
ightarrow |\mathbb{Q}2\mathbb{R}|q-_{\mathbb{R}}r|<_{\mathbb{R}}2_{\mathbb{R}}^{-2}
ightarrow q\leq_{\mathbb{Q}}1/4_{\mathbb{Q}}
ightarrow r\leq_{\mathbb{R}}1/2_{\mathbb{R}}$$

In fact the more is postulated the faster the program (and the easier one can see what is computed).

ヘロト 人間ト ヘヨト ヘヨト

Separation of Logic and Computation

- Postulates allow us to have a two-layered theory with
 - computational part (using non-postulated types)
 - ▶ an a logic part (using postulated types).

・ロト ・同ト ・ヨト ・ヨト

Useful for Programming with Dependent Types

- ► This could be very useful for programming with dependent types.
 - Postulate axioms with no computational content.
 - Possibly prove them using automated theorem provers (approach by Bove, Dybjer et. al.).
 - Concentrate in programming on computational part.

Experiments carried out

- In about 6 hours I developed a framework using Cauchy Reals, Signed Digit Reals, conversion into streams and lists form scratch.
 - ► Allowed the computation of the first 10 digits of rational numbers in [-1,1].
- ► Framework is easy to use since most proofs are replaced by postulates.
- Chi Ming Chuang showed closure of signed digit reals under average and multiplication using more efficient direct calculations and full proofs of most theorems needed.
- ► Was able to calculated fast the first 1000 digits of rational numbers.

Idea: Type Theory with Partial and Total Objects

One could postulate

- types of partial elements,
- constants operating on those types,
- equations for those constants .
- Then one can
 - define predicates on those partial elements corresponding to the total elements,
 - and show that certain partial elements are total or have other properties.

イロト 不得 トイヨト イヨト 二日

Example

 $\mathbb{N}_{\text{partial}}$: Set postulate postulate $_==_$: $\mathbb{N}_{\text{partial}} \to \mathbb{N}_{\text{partial}} \to \text{Set}$ postulate 0 : N_{partial} postulate suc : $\mathbb{N}_{\text{partial}} \to \mathbb{N}_{\text{partial}}$ postulate f : $\mathbb{N}_{\text{partial}} \to \mathbb{N}_{\text{partial}}$ postulate lemf0 : $f 0 == \cdots$ postulate lemfs : $(n : \mathbb{N}_{partial}) \to f(suc n) == \cdots$ data $\mathbb{N}: \mathbb{N}_{\text{partial}} \to \text{Set where}$ $\operatorname{zerop}: \mathbb{N} \mathbf{0}$ succp : $(n : \mathbb{N}_{\text{partial}}) \to \mathbb{N} \ n \to \mathbb{N} \ (\text{suc } n)$ eqp: $(n \ m : \mathbb{N}_{\text{partial}}) \to \mathbb{N} \ n \to n == m \to \mathbb{N} \ m$ lemma : $(n : \mathbb{N}_{\text{partial}}) \to \mathbb{N} \ n \to \mathbb{N} \ (f \ n)$ lemma $n p = \cdots$ ・ロト ・ 雪 ト ・ ヨ ト ・ ヨ ト

Conclusion

- 4 同 ト 4 回 ト

Conclusion

- If result types of postulated constants are postulated types, then closed elements of algebraic types evaluate to constructor normal form.
- Reduces the need burden of proofs while programming (by postulating axioms or proving them using ATP).
- Axiomatic treatment of \mathbb{R} .
- Program extraction for proofs with real number computations works very well.
- ► Applications to programming with dependent types in general.
- ► Possible solution for type theory with partiality and totality.
