Algebraic Data Types

Algebraic data types one of the main ingredients of Agda.

data List
$$(A : Set)$$
 : Set where
[] : List A
_::__ : $A \rightarrow List A \rightarrow List A$

Notation:

$$[]' + A ::' X$$

stands for the labelled disjoint union, i.e. the set *B* containing elements []' and $a ::' \times for \ a : A$ and x : X. Let

$$F_A : \text{Set} \to \text{Set}$$

 $F_A X = []' + A ::' X$

3/44

Algebraic Data Types

$F_A X = []' + A ::' X$

Then the following is essentially equivalent to the definition of List A:

data List
$$(A : Set) : Set$$
 where
intro : $F(List A) \rightarrow List A$

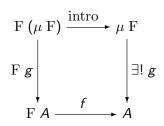

where

$$\begin{bmatrix} I \\ a :: I \end{bmatrix} = \text{ intro } \begin{bmatrix} I' \\ a :: I' \end{bmatrix}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ●□ ●

Algebraic Data Types

The introduction elimination and equality rules for algebraic data types follow then from the diagram for initial *F*-algebras (denoted by μ F)

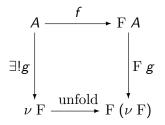

One writes $\mu X.t$ for $\mu (\lambda X.t)$ e.g.

List $A = \mu X \cdot []' + A :::' X$

▲口 ▶ ▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ ― 臣 …

Final Coalgebras

Final Coalgebras ν F are obtained by reversing the arrows:

Again we write $\nu X.t$ for $\nu (\lambda X.t)$.

In weakly final coalgbras the uniqueness of g is omitted.

Coalgebras can be used to model **interactive programs** and **objects** from **object-oriented programming** in dependent type theory.

・ロット 4 聞 > 4 通 > 4 画 > 一面

Suggested Notation

coalg coList (A : Set) : Set where unfold : coList $A \rightarrow [] + A ::'$ coList A

- ► To an element of coList *A* as above we can apply unfold as above.
- Furthermore from the finality we can derive the principle of guarded recursion:

We can define $f : B \to \text{coList } A$ by saying what unfold $(f \ b)$ is:

- ► []′
- *a* ::' *I* for some *a* : *A*, *I* : coList *A*
- ► *a* ::' *f b*' for some *a* : *A*, *b*' : *B*.

- 3. Codata and \sim
- 4. ∞A
- 5. Understanding Nested Algebras and Coalgebras
- 5. Model

Using Several Destructors

When using data we had several constructors. Similarly we can allow for coalg several destructors. Example:

coalg Stream (A : Set): Set where head : Stream $A \rightarrow A$ tail : Stream $A \rightarrow$ Stream A

inc : $\mathbb{N} \to \text{Stream } \mathbb{N}$ head (inc n) = ntail (inc n) = inc (n + 1)

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ● ●

Nested Destructor Patterns

We can even define nested destructor patterns (Andreas Abel):

$$inc' : \mathbb{N} \to \text{Stream } \mathbb{N}$$

head (inc' n) = n
head (tail (inc' n)) = n+1
tail (tail (inc' n)) = inc' (n+2)

Fibonacci

Not guarded recursion but can be justified by sized types. Or (not very useful but the result of unfolding the sized version(?)):

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Combining Constructor and Destructor Patterns

We can combine constructor and destructor patterns:

 $inc'' : \mathbb{N} \to \text{Stream } \mathbb{N}$ head (inc'' zero) = 0 head (tail (inc'' zero)) = 1 tail (tail (inc'' zero)) = inc'' 2 head (inc'' (suc n)) = suc n tail (inc'' (suc n)) = inc'' (n+1)

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

Objects

coalg Stack
$$(A : Set) : \mathbb{N} \to Set$$
 where
top : $\{n : \mathbb{N}\} \to Stack (suc n) \to A$
pop : $\{n : \mathbb{N}\} \to Stack (suc n) \to Stack n$

16/44

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

Objects

 $\begin{array}{ll} \text{coalg Stack } (A:\text{Set}):\mathbb{N} \to \text{Set where} \\ \text{top} & : & \{n:\mathbb{N}\} \to \text{Stack } (\text{suc } n) \to A \\ \text{pop} & : & \{n:\mathbb{N}\} \to \text{Stack } (\text{suc } n) \to \text{Stack } n \end{array}$

The empty stack is introduced as follows:

emptystack : $\{A : Set\} \rightarrow Stack \ A \ zero$ () - no destructor applies

Note that the coalgebra Stack zero has no destructors and contains exactly one element up to bisimularity. (Slide improved after comments during the talk)

Complications with Coalgebras

Several constructors for **data** corresponds to disjoint unions of the argument types.

data List (A : Set) : Set where [] : List A_ :: _ : $A \rightarrow List A \rightarrow List A$

corresponds to

data List (A : Set): Set where intro : $\mathbf{1} + (A \times \text{List } A) \rightarrow \text{List } A$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三日 - つへつ

Complications with Coalgebras

Several destructors for **coalg** corresponds to the product of the argument types:

data Stream (A : Set) : Set where head : Stream $A \rightarrow A$ tail : Stream $A \rightarrow$ Stream A

corresponds to

data Stream (A : Set): Set where unfold : Stream $A \to A \times Stream A$

21/44

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ●

Complications with Coalgebras

If we dualise data types introduced by several constructors, we obtain types which are more complicated to describe: List looks nice:

data List
$$(A : Set)$$
 : Set where
[] : List A
:: : $A \rightarrow List A \rightarrow List A$

whereas colists don't look nice

coalg coList
$$(A : Set)$$
 : Set where
unfold : coList $A \rightarrow [] + A ::'$ coList A

イロト 不得 トイヨト イヨト 二日

Codata

Codata types seem to solve this problem:

So elements of coList are now introduced by introduction rules which allows to define the disjoint union nicely.

Idea is that elements of coList A are infinitary lists:

$$\blacktriangleright \quad n_1 :: n_2 :: n_3 :: \cdots$$

•
$$n_1 :: n_2 :: n_3 :: \cdots :: n_k :: []$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三日 - つへつ

Problem of codata

► No normalisation, e.g.

```
\mathrm{inc}\; 0=0::1::2::\cdots
```

Undecidability of equality.

In case of coalgebras

- Elements of coalgebras are not expanded indefinitely. They are only expanded if unfold is applied to them.
- In case of weakly final coalgebras equality of elements of the coalgebras is equality of the underlying algorithms.

Pseudo-Constructors

If we have

coalg coList
$$(A : Set)$$
: Set where
unfold : coList $A \rightarrow []' + A ::'$ coList A

we can define by guarded recursion

[] : coList Aunfold [] = []' . :: _: A : Set $\rightarrow A \rightarrow$ coList $A \rightarrow$ coList Aunfold (a :: l) = a ::' l

◆□ > ◆母 > ◆臣 > ◆臣 > 善臣 - のへで

Pseudo-Constructors

However we do not have

unfold I = a ::' I' implies I = a :: I

So elements of coList A are not of the form [] or a :: I. But behave like [] or a :: I.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

 \sim -Notation (Nils Danielsson)

is an abbreviation for

coalg coList (A : Set): Set where unfold : coList $A \rightarrow []' + A ::'$ coList A

 $[]: A: Set \to coList A$ unfold [] = []'

 $::: _: A : Set \to A \to coList A \to coList A$ unfold (a :: l) = a ::' l

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三日 - つへつ

\sim -Notation (Nils Danielsson)

Furthermore let

$$s \sim t \Leftrightarrow \text{unfold } s = \text{unfold } t$$

Then

unfold
$$s = []' \Leftrightarrow s \sim []$$

unfold $s = a ::' I \Leftrightarrow s \sim a :: I$

so there is no need to write []' or $_::'_-$ or unfold. Unfortunaly \sim was replaced by = which misled the users.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

- 1. Coalgebras as Defined By Elimination Rules
- 2. Using Destructors: Destructor Patterns, Objects
- 3. Codata and \sim
- 4. ∞A
- 5. Understanding Nested Algebras and Coalgebras
- 5. Model

Nils Danielsson and Thorsten Altenkirch suggested to have the following

$$\infty : \text{Set} \to \text{Set}$$

$$\flat : \{B : \text{Set}\} \to B \to \infty B$$

$$\natural : \{B : \text{Set}\} \to \infty B \to B$$

 ∞ *B* denote coalgebraic arguments in a definition (which can be "expanded infinitely") and one defines coList *A* as

data coList (A : Set) : Set where [] : coList A_::__ : $A \to \infty$ (coList A) \to coList A

30/44

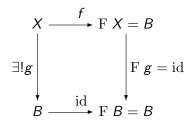

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

What is ∞B ?

 ∞B cannot mean

$\nu X.B$

since $\nu X.B$ is as a (non-weakly) final coalgebra isomorphic to B: With F X = B we get

<ロト <部ト < 注ト < 注ト = 注

 ν gives something real only if applied to a functor. Applied to a set (or $\lambda X.A$ for a set A) it is essentially the identity. So ∞ must be something like (Set \rightarrow Set) \rightarrow Set.

イロト 不得 トイヨト イヨト 二日

What is ∞A ?

What is meant by it is, that if A is defined as an algebraic data type, ∞A is defined mutually coalgebraically:

data coList (A : Set) : Set where [] : coList A_::__ : $A \to \infty$ (coList A) \to coList A

stands for

data coList (A : Set) : Set where [] : coList A_:: _ : $A \to \infty$ (coList A) \to coList A

coalg ∞ (coList_) (A : Set) : Set where $\natural : \infty$ (coList A) \rightarrow coList A

4. ∞A

Order between data/codata

data coList
$$(A : Set)$$
 : Set where
[] : coList A
:: : $A \to \infty$ (coList A) \to coList A
coalg ∞ (coList_) ($A : Set$) : Set where
 $\natural : \infty$ (coList A) \to coList A

But there are two interpretations of the above: 1.

$$F(X, Y) = [] + A :: Y$$

$$G(X, Y) = X$$

$$F'(Y) = \mu X.F(X, Y) = \mu X.[] + A :: Y$$

$$\cong [] + A :: Y$$

$$\infty \text{ (coList } A) = \nu Y.G(F'(Y), Y) = \nu Y.F'(Y)$$

$$\cong \nu Y.[] + A :: Y$$

$$\text{coList } A = F'(\infty \text{ (coList } A))$$

$$= [] + A :: (\infty \text{ (coList } A)) + \mathbb{R} + \mathbb{R} + \mathbb{R}$$

Order between data/codata

data coList
$$(A : Set)$$
 : Set where
[] : coList A
_::__ : $A \to \infty$ (coList A) \to coList A
coalg ∞ (coList_) ($A : Set$) : Set where
 $\natural : \infty$ (coList A) \to coList A

$$G(X, Y) = X$$

$$F(X, Y) = [] + A :: Y$$

$$G'(X) = \nu Y.G(X, Y) = \nu Y.X$$

$$\cong X$$

$$coList A = \mu X.F(X, G'(X)) \cong \mu X.F(X, X)$$

$$= \mu X.[] + A :: X$$

$$\infty (coList A) = G'(coList A)$$

$$\cong coList A$$

E

Order between data/codata

First solution gives the desired result.

Origin of problem:

- ► If we have two functors F(X, Y), and G(X, Y) and if we want to minimize X and maximize Y there are two solutions:
 - Minimize X as a functor depending on Y. Then maximize Y.
 - ► Maximize *Y* as a functor depending on *X*. Then minimize *X*.
- With mutual data types this problem didn't occur since if we minimize both X and Y, the order doesn't matter.

5. Understanding Nested Algebras and Coalgebras

In general we want to be able to form arbitrary combinations of μ and $\nu.$ Idea: minimize and maximize in the order of occurrence.

data A: Set where intro₀ : $F(A, B, C, D) \rightarrow A$ coalg B: Set where unfold₀ : $B \rightarrow G(A, B, C, D)$ data C: Set where intro₁ : $H(A, B, C, D) \rightarrow C$ coalg D: Set where unfold₁ : $D \rightarrow K(A, B, C, D)$

to be interpreted as:

$$\begin{array}{rcl} F_0(Y,Z,Z') &=& \mu X.F(X,Y,Z,Z') & A \text{ in terms of } Y,Z,Z' \\ G_1(Z,Z') &=& \nu Y.G(F'(Y,Z,Z'),Y,Z,Z') & B \text{ in terms of } Z,Z' \\ F_1(Z,Z') &=& F_0(G_1(Z,Z'),Z,Z') & A \text{ in terms of } Z,Z' \\ H_2(Z') &=& \mu Z.H(F_1(Z,Z'),G_1(Z,Z'),Z,Z') & C \text{ in terms of } Z' \\ G_2(Z') &=& G_1(H_2(Z'),Z') & B \text{ in terms of } Z' \\ F_2(Z') &=& F_1(H_2(Z'),Z') & A \text{ in terms of } Z' \\ D &=& \nu Z'.K(F_2(Z'),G_2(Z'),H_2(Z'),Z') & \text{Final Value of } D \\ C &=& H_2(D) & \text{Final Value of } C \\ B &=& G_2(D) & \text{Final Value of } B \\ A &=& F_2(D) & \text{Final Value of } A \end{array}$$

Example: coList A

data coList (
$$A$$
 : Set) : Set where
[] : coList A
_::__ : $A \to \infty$ (coList A) \to coList A

stands for

data coList (A : Set) : Set where [] : coList A_::__ : $A \to \infty$ (coList A) \to coList A

 $\begin{array}{l} \operatorname{coalg} \infty \left(\operatorname{coList}_{-} \right) \left(A : \operatorname{Set} \right) : \operatorname{Set} \, \operatorname{where} \\ \natural : \infty \left(\operatorname{coList} A \right) \to \operatorname{coList} A \end{array}$

<ロト <部ト < 注ト < 注ト = 注

inclist

With

$$inclist : \mathbb{N} \to \infty \text{ (coList } \mathbb{N})$$

$$\natural \text{ (inclist } n) = n :: inclist (n + 1)$$
or
$$inclist n \sim \flat (n :: inclist (n + 1))$$

$$s \triangleright t : \Leftrightarrow \natural s = t$$

we get

inclist $n \triangleright n$:: inclist (n + 1)

42/44

Model

Form a term model with reduction rules corresponding to the equalities stated.

E.g. inclist is a function symbol with equality rule

unfold (inclist
$$n$$
) = n :: (inclist $(n + 1)$)

Interpretation of $\mu X.F(X)$:

$$\llbracket \mu X.F(X) \rrbracket = \bigcap \{ X \subseteq \text{Term} \mid \text{intro}[\llbracket F(X) \rrbracket] \subseteq X \}$$

Interpretation of $\nu X.F(X)$:

 $\llbracket \nu X.F(X) \rrbracket = \bigcup \{ X \subseteq \operatorname{Term} \mid \operatorname{unfold}[X] \subseteq \llbracket F(X) \rrbracket \}$

Conclusion

- Design decisions should be done by referring to the notion of coalgebras.
- ► Coalgebras with constructor/destructor patterns looks very neat.
- ► Other solutions ~, ∞ don't look very elegant at the moment and need a proper semantic treatment.
 - $\blacktriangleright~\sim$ was a reasonable good abbreviation mechanism.
- ► If A is a data type referring to ∞ A, then ∞ A gets is meaning as a coalgebra defined implicitly mutually after the definition of A.
- Order of algebras coalgebras matters.
- Suggestion by Peter Hancock: Why not use μ and ν ?
 - Not really necessary, since we can built up expressions of nested μ, ν using mutual algebras and coalgebras understood in our way.
