# An intuitionistic theory of types $$\Bbbk$$

#### Per Martin-Löf

Department of Mathematics, University of Stockholm

The theory of types with which we shall be concerned is intended to be a full scale system for formalizing intuitionistic mathematics as developed, for example, in the book by Bishop 1967. The language of the theory is richer than the language of first order predicate logic. This makes it possible to strengthen the axioms for existence and disjunction. In the case of existence, the possibility of strengthening the usual elimination rule seems first to have been indicated by Howard 1969, whose proposed axioms are special cases of the existential elimination rule of the present theory. Furthermore, there is a reflection principle which links the generation of objects and types and plays somewhat the same role for the present theory as does the replacement axiom for Zermelo-Fraenkel set theory.

An earlier, not yet conclusive, attempt at formulating a theory of this kind was made by Scott 1970. Also related, although less closely, are the type and

	On the Meaning and Construction of the Rules in Martin-Löf's Theory of Types Roland Backhouse Department of Mathematics and Computing Science University of Groningen PO Box 800 9700 AV GRONINGEN The Netherlands
	Abstract We describe a method to construct the elimination and computation rules from the forma- tion and introduction rules for a type in Martin-Löt's theory of types. The construction is based on an

tion and introduction rules for a type in Martin-Löf's theory of types. The construction is based on an understanding of the inference rules in the theory as judgements in a pre-theory. The motivation for the construction is to permit disciplined extensions to the theory as well as to have a deeper understanding of its structure.

## Motivation of Backhouse

equipped to adapt the theory to mutvidual needs

The present work grew out of a feeling of discontent with the theory. On first encounter the universal reaction among computing scientists appears to be that the theory is formidable. Indeed, several have specifically referred to the overwhelming number of rules in the theory. On closer examination, however, the theory betrays a rich structure — a structure that is much deeper than the superficial observation that types are defined by introduction, elimination and computation rules. Once recognised this structure considerably reduces the burden of understanding. And yet, to my knowledge, the structure of the theory has not been properly discussed or documented, Martin-Lof, himself, alludes to the fact that there is a "pattern ... in the type forming operations" in the preface to the notes prepared by Giovanni Sambin [ML1], but he does not give a detailed account of the pattern.

So much for the ideological motivations for this paper. At a more practical level it has become increasingly clear to us that there is a need to freely permit disciplined extensions to the theory. That the theory is open to extension is a fact that was clearly intended by Martin-Lof. Indeed, it is a fact that has been exploited by several individuals; Nordström, Petersson and Smith [NPS] have extended the theory to include lists, they and Constable et al [Co] have added subset types and Constable et al have introduced quotient types, Nordström has introduced multi-level functions [No], Chisholm has introduced a very special-purpose type of tree structure [Ch] and Dyckhoff [Dy] has defined the type of categories.

Initially we were against such extensions on the grounds that it is often possible to define them in terms of the W-type (for examples see [Kh]), because they add to the complexity of the theory and because they

Conclusion and Future

イロト イヨト イヨト

## Ingredient 1: Universes à la Tarski

- ► Universes à la Russell occurred in Martin-Löf 1972.
- History of universes à la Tarski is according to an email by by Peter Dybjer on the Agda email List as follows:
  - The universe a la Tarski appeared for the first time, I believe, in the book Intuitionistic Type Theory (Bibliopolis) from 1984. It was based on lectures in Padova given in 1980.
     Previously, universes were a la Russell.
     Aczel had a universe a la Tarski in his 1974/1977 paper about the Interpretation of Martin-Löf Type Theory in a First Order Theory of
  - Combinators.
- So Aczel 1974/77 probably first occurrence of Tarski universes in literature, although they might have been around at that time.
- Peter Aczel private communication: Defining a realisability model forced to have a Tarski style universe.

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

## Ingredient 2: Elimination Rules for Universes

- Martin-Löf mentions, in his 1972 paper the existence of a "principle of (transfinite) induction over V", but rejects it on the grounds that the Russel style universe V should be open in the sense of adding later closure under type constructors
   (p. 7 of the printed version in 25 years of constructive type theory, thanks to Thierry Coquand for pointing this out to AS).
- ► First formal presentation seems to be in Peter Aczel's 1974/77 paper.

イロト 不得 トイヨト イヨト 二日

## Ingredient 3: Computability Predicate in Martin-Löf 1972

- According Peter Dybjer major inspiration for the principle of induction-recursion.
- ► Shows that universes are an example of a more general schema.

Universes and a General Notion of Simultaneous	
Inductive-Recursive Definition in Type Theory	
(Dreft)	
k (Drait)	
Peter Dybier*	
Chalmers University of Technology	
August 1992	
Abstract	
In Martin-Löf's type theory we may define new sets (and families of sets) inductively,	
and new functions by recursion on the way the elements of these sets are generated. The schema for such definitions that we considered before includes all the standard set formers	
of type theory with the exception of universes.	
Here we give an extended schema which also covers universes a la Tarski. These consist of simultaneous inductive definitions of sets of codes for small sets and recursive definitions	
of decoding functions. This extension is a small modification of the old schema and includes	
There are several interesting applications of this extension. Here we show how to obtain	
an external universe hierarchy, where each level in the hierarchy faithfully reflects the previ-	
These include an internal unfaithful universe hierarchy and a super universe.	
Other examples are the construction of Frege structures in type theory, and various constructions relevant to the formalization of type theory inside type theory.

Emergence of Inductive-Recursive Definitions

#### JSL Paper Peter Dybjer (2000)

time as a function T<sub>0</sub>, which maps a code to the corresponding small set, is defined by recursion on the way the elements of U<sub>0</sub> are generated.

In this paper we argue that there is an underlying general notion of simultaneous inductive-recursive definition which is implicit in Martin-Löf's intuitionistic type theory. We extend previously given schematic formulations of inductive definitions in type theory to encompass a general notion of simultaneous inductionrecursion. This enables us to give a unified treatment of several interesting constructions including various universe constructions by Palmgren, Griffor, Rathjen, and Setzer and a constructive version of Aczel's Frege structures. Consistency of a restricted version of the extension is shown by constructing a realisability model in the style of Allen

Anton Setzer

# Visualisation (U)

### Analysis

- ► Elements of U are defined inductively, while defining T(a) : Set for a : U recursively.
- As before we have inductive Arguments, non-inductive arguments
- Later arguments can depend on
  - previous non-inductive arguments (as before),
  - ► T applied to previous inductive arguments.
- Principle can be generalised to T(u) : D for any type D.
  - ► E.g. D = Fam(Set) → Fam(Set).
     Erik Palmgren's higher order universes.
  - ▶ E.g. *D* : Set.

Conclusion and Future

(日) (同) (三) (三) (三)

## Closed Formalisation of Induction-Recursion

#### 1999 A.S. and Peter Dybjer: A finite axiomatization of inductive-recursive definitions.

- Goal was to develop a finite axiomatisation of induction-recursion which allows a proof theoretic analysis.
- Observation that in order to introduce a new inductive-recursive definition, a proof obligation needs to be fulfilled: Proof that the sets used in inductive and non-inductive arguments are sets depending on previous arguments.
- Data type of inductive-recursive definitions.
- Data type has ingredients of the Mahlo universe.

・ロト ・ 同ト ・ ヨト ・ ヨト

## Induction-Recursion and Initial Algebras

- Slight reformulation of closed formalisation of induction-recursion.
- Proof of equivalence of elimination rules for induction recursion and induction recursion as initial algebra.
- Proof that induction recursion reaches the proof-theoretic strength of at least KPM. (This does not rely on the data type of induction-recursion).

# Indexed Induction Recursion (Peter Dybjer, AS, 2001)

- Extension to indexed induction-recursion.
- Difference between restricted and generalised indexed IR.
  - ► Restricted means that for each index *i* you determine the type of constructors for U<sub>i</sub>.
  - Generalised defines for each constructor its resulting index. Example: identity type.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

## Many more Investigations

- E.g. Bove/Capretta's formulation of partial functions as inductive-recursive definitions.
- ► Use of induction recursion in generic programming
- Examples:

. . .

- Recently Randy Pollack usage of induction-recursion in his theory of bindings.
- Surreal numbers as an extended inductive-recursive definition and inductive-inductive definition (Forsberg).

Principle of Induction-Recursion

Further Development of Induction-Recursion

**Recent Developments** 

Conclusion and Future

# Induction-Induction (Forsberg, AS)

- Induction-Induction means that we define
  - ► A : Set inductively,
  - while defining simultaneously  $B : A \rightarrow Set$  inductively.
- Extracted from PhD thesis Danielsson (2007) formalising the syntax of inductive definitions.
- Essentially
  - Induction-recursion allows to formulate models of type theory
  - Induction-induction allows to formulate the syntax of type theory.

イロト 不得 トイヨト イヨト 二日

**Recent Developments** 

# Defining Syntax using Induction-Induction

- ► Formulate Syntax of Type Theory inside Type Theory
- Define inductively simultaneously:
  - ► Context : Set.  $\blacktriangleright$   $\Gamma$  : Context represents  $\Gamma \Rightarrow \text{Context.}$ •  $\widehat{\operatorname{Set}}$  :  $\widehat{\operatorname{Context}} \to \operatorname{Set}$ . •  $A : \widehat{\operatorname{Set}} \Gamma$  represents  $\Gamma \Rightarrow A : Set.$ •  $\widehat{\text{Term}}$  :  $(\Gamma : \widehat{\text{Context}}) \to (A : \widehat{\text{Set}} \Gamma) \to \text{Set}.$ •  $r : \widetilde{\text{Term}} \Gamma A$  represents  $\Gamma \Rightarrow r : A.$ •  $\widehat{\operatorname{Set}}_{=}$  : ( $\Gamma$  :  $\widehat{\operatorname{Context}}$ )  $\rightarrow$  (A, B :  $\widehat{\operatorname{Set}}$   $\Gamma$ )  $\rightarrow$  Set. •  $p: \widehat{\operatorname{Set}}_{=} \Gamma A B$  represents a derivation of  $\Gamma \Rightarrow A = B$ : Set.

etc.

# Fibred Induction-Recursion

• Let 
$$\operatorname{Fam}(D) := (U : \operatorname{Set}) \times (U \to D).$$

The functor

 $\begin{aligned} \mathrm{index}:\mathrm{Fam}(D)\to\mathrm{Set}\\ \mathrm{index}(\langle U,T\rangle)=U \end{aligned}$ 

is a split fibration.

Replace

- index : Fam(D) → Set by an arbitrary split fibration K : E → B, therefore (U, T) : Fam(D) is replaced by Q : E
- $A \rightarrow D$  by the discrete fibre  $|\mathcal{E}_A|$  over A,
- $T \circ g$  (for  $g : A \to U$ ) by  $g^*(Q)$ ,
- F(T ∘ a) by F(g<sup>\*</sup>(Q)).

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ● ●

# New Rule

$$\frac{A:\mathcal{B} \quad F: |\mathcal{E}_A| \to \mathrm{IR}_K}{\delta_A(F): \mathrm{IR}_K}$$
$$\mathbb{F}_{\delta_A(F)}(Q) = (g: A \to K | Q) \times \mathbb{F}_{F(g^*(Q)}(Q)$$

## What do we get?

- ► Generalisation from Fam(D) to arbitrary fibrations.
- Indexed IR is now a special cases.
- ► Relational IR (define U : Set and T : U × U → Set) might become an example.
- $\mathbb{F}_{\gamma} : \mathcal{E}^{sp} \to \mathcal{E}^{sp}$  is a functor.
- Existence theorem of initial algebras for  $\mathbb{F}_{\gamma}$ .
