Indexed Inductive-Recursive Definitions

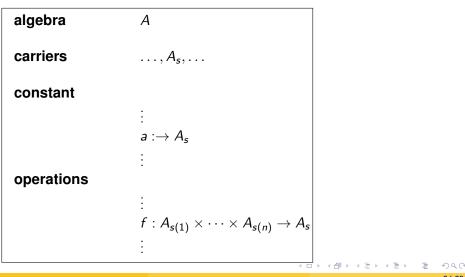

Induction-Induction

Coalgebras

2/30

From the infamous "TPL Book"

Alternatively, an algebra may be displayed expansively in the following way:

3/ 30

- We use functional notation $f_{a_1 \cdots a_n}$ instead of $f(a_1, \dots, a_n)$.
- ► A₁+...+A₀ is the disjoint union of A_i.
 If there is a natural index i for A_i (usually an operation) let

$$\underline{in}_i: A_i \to A_1 + \cdots + A_n$$

be the injection.

- We write *a* : *A* for *a* is of type *A*.
- Set denotes the type of sets,
 - $S \rightarrow Set$ is the type of *S*-indexed sets.

・ロト ・ 一日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

Dependent Function/Sum Type

► We define the **dependent function type**

 $(a:A) \rightarrow B[a]$

of functions mapping a : A to an element of B[a].

We define the <u>dependent sum type</u>

 $(a:A) \times B[a]$

consisting of $\langle a, b \rangle$ s.t. a : A, b : B[a].

Coalgebras

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Single Sorted Case (Omit S)

Latfor a. V. Cat

• Let for
$$a :\to A$$
, $X : Set$,
 $F_a(X) := \{*\}$
So essentially
 $a : F_a(A) \to A$
• Let for $f : A^n \to A$, $X : Set$
 $F_f(X) := X^n$
So
 $f : F_f(A) \to A$
• Let
 $F(X) := F_{f_1}(X) + \dots + F_{f_l}(X)$
So
 $\vec{t} := [f_1, \dots, f_n] : F(A) \to A$

• (A, \vec{f}) is an *F*-algebra.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Multi Sorted Case, Restricted Version

- Let $S := \{s_1, \ldots, s_n\}$ be the set of all sorts.
- Consider A as of type $A: S \to Set$.
- Assume now $X : S \rightarrow Set$
 - If $a :\to A_s$, let

$$\underbrace{F_a(X)}_{(X)} := \{*\}$$

► If
$$f : A_{s(1)} \times \cdots \times A_{s(n)} \to A_s$$
, let
$$\underbrace{F_a(X)}_{s(1)} := X_{s(1)} \times \cdots \times X_{s(n)}$$

Let for *s* : *S*

$$F^{s}(X) := F_{f_{i_1}}(X) + \cdots + F_{f_{i_j}}(X)$$

where f_{i_1}, \ldots, f_{i_l} are the functions with target type A_s . • Define

$$\begin{split} f:(s:S) &\to F^{s}(A) \to A_{s} ,\\ \vec{f} s(\text{in}_{a}*) &= a ,\\ \vec{f} s(\text{in}_{f} \langle x_{1}, \dots, x_{n} \rangle) &= f(x_{1}, \dots, x_{n}) \\ & (a \to A) \in \mathbb{R} , \quad ($$

8/ 30

Multi Sorted Case, Generalised Version

• Let S, A, F_a, F_f as before

Let

$$F(X) := F_{f_1}(X) + \cdots + F_{f_n}(X)$$

where f_1, \ldots, f_l are all the constants and operations of A. • Define

index : $F(X) \rightarrow S$

where if $f: A_{s_1} \times \cdots \times A_{s_n} \to A_s$, then $\operatorname{index} (\operatorname{in}_{f_i} \langle x_1, \dots, x_n \rangle) = s$

Define

$$\begin{split} \vec{f} &: (a:F(A)) \to A_{\text{index } s} \ , \\ \vec{f} &: (\text{in}_{a} *) = a \\ \vec{f} &: (\text{in}_{f} \langle x_{1}, \dots, x_{n} \rangle) = f \langle x_{1}, \dots, x_{n} \rangle \end{split}$$

• Then (A, \vec{f}) is a generalised *F*-algebra because of the type of \vec{f} .

Generalisation

- Up to now F(X) is the disjoint union of products of X_i .
- ► We can throw in as basic sets as well some B : Set defined before. These will be called "non-inductive arguments".
 - Used when forming algebras referring to other algebras.
- ► We can refer to many arguments of X_s simultaneously. So we have arguments of type

$$(b:B) \rightarrow X_{s(b)}$$

where B : Set, $s : B \rightarrow S$.

These arguments are called "inductive arguments".

イロト 不得 トイヨト イヨト 二日

Generalisation

- We can allow the type of later arguments depend on previous non-inductive arguments.
- ► We replace

$$F_{f_1}(X) + \cdots + F_{f_n}(X)$$

by

$$(f: \{f_1,\ldots,f_n\}) \times F_f(X)$$

so we need no disjoint union.

We define polynomial functors for the general case, the restricted version is a special case of this.

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・ ヨ

- The set of polynomial functors F : (S → Set) → Set together with index : F X) → S is given by
 - Base Case:

The following is polynomial (s : S):

$$F X = \{*\}$$

index $* = s$

Non-inductive Argument:

Assume B: Set and that for b: B we have (F_b, index_b) is polynomial. The following is polynomial:

$$F X = (b:B) \times F_b X$$

index $\langle b, x \rangle = \text{index}_b x$

Inductive Argument:

Assume $B : \text{Set}, s : B \to S$, (F', index') is polynomial. The following is polynomial:

$$F X = ((b:B) \to X_{s(b)}) \times F' X$$

index $\langle x, y \rangle = \text{index}' y$

Restricted/Generalised Indexed Inductive Definitions

 Restricted indexed inductive definitions are initial algebras for polynomial functors

> $F_s: (S \to \text{Set}) \to \text{Set}$, index_s x = s

and the introduction rule has the form

intro :
$$(s:S) \rightarrow F_s A \rightarrow A_s$$

 Generalised indexed inductive definitions are initial algebras for a polynomial functor

$$F: (S \to \text{Set}) \to \text{Set}$$
,
index: $F X \to S$

and the introduction rule has the form

$$intro: (x: F A) \to A_{index x}$$

Coalgebras

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Asymmetry of Indexed Inductive Definitions

Asymmetry of arguments:

- Only dependency on non-inductive arguments not on inductive arguments.
- ► Direct dependency not possible, since we don't know what X is.
- ▶ Solution: instead of defining just $X : S \rightarrow Set$ define
 - $X : S \rightarrow \text{Set}$ inductively together with
 - $T: (s:S) \to X_s \to D[s]$ recursively for some type D[s].
 - ► Later arguments can depend on *T* applied to inductive arguments.

Generalised Indexed Inductive Definitions

▶ Let $\operatorname{Fam}_{S}(D) := (X : S \to \operatorname{Set}) \times ((s : S) \to X \ s \to D[s]).$

So define

$$\begin{array}{l} F: \operatorname{Fam}_{S}(D) \to \operatorname{Set} \\ \operatorname{index} : F \: X \to S \\ \operatorname{toD} : (x: F \: X) \to D[\operatorname{index} x] \end{array}$$

The formation and introduction rules are now

$$egin{aligned} & A:S
ightarrow ext{States} \ & T:(s:S)
ightarrow A \ s
ightarrow D[s] \end{aligned}$$

intro :
$$(a : F \langle A, T \rangle) \rightarrow A_{index a}$$

T (index a) (intro a) = toD a

◆□ > ◆母 > ◆臣 > ◆臣 > 善臣 - のへで

The set of polynomial functors with related functions

 $\begin{array}{l} F: \operatorname{Fam}_{S}(D) \to \operatorname{Set} \\ \operatorname{index} : F \: X \to S \\ \operatorname{toD} : (x: F \: X) \to D[\operatorname{index} x] \end{array}$

is defined as follows:

Base Case:

Let s : S, d : D[s]. The following is polynomial:

> $F X = \{*\}$ index * = s toD * = d

◆□ > ◆母 > ◆臣 > ◆臣 > 善臣 - のへで

Non-inductive Argument:

Assume B: Set and for b: B we have (F_b, index_b) is polynomial. The following is polynomial:

$$\begin{array}{ll} F \ X = (b:B) \times F_b \ X \ , \\ \mathrm{index} & \langle b, x \rangle \ = \ \mathrm{index}_b \ x \ , \\ \mathrm{toD} & \langle b, x \rangle \ = \ \mathrm{toD}_b \ x \ . \end{array}$$

<ロ> <部> < 部> < き> < き> < き</p>

Inductive Argument:

Assume $B : \text{Set}, s : B \to S$. Assume for $t : (b : B) \to D[s \ b]$ we have

 $(F_t, \operatorname{index}_t, \operatorname{toD}_t)$

are polynomial.

The following is polynomial

$$\begin{array}{ll} F\left\langle X,T\right\rangle =\left(f:\left(b:B\right)\rightarrow X_{s\,b}\right)\times F_{tof}\left\langle X,t\right\rangle \ ,\\ \mathrm{index}\quad \left\langle f,X\right\rangle &=&\mathrm{index}_{tof}\quad x\ ,\\ \mathrm{toD}\quad \left\langle f,X\right\rangle &=&\mathrm{toD}_{tof}\quad x\ . \end{array}$$

Induction-Induction

- PhD Project of Fredrik Forsberg.
- ► In single sorted Induction Recursion we defined
 - ► A : Set inductively, while defining
 - $T: A \rightarrow D$ recursively.
- ► In Induction Induction we define
 - ► A : Set inductively, while defining
 - $B: A \rightarrow Set$ inductively.

Example Surreal Numbers

We define the surreal numbers

 $\mathsf{Surreal}:\mathsf{Set}$

together with relations

$$\begin{array}{rcl} x \leq y & : & \operatorname{Set} \\ x \not\leq y & : & \operatorname{Set} \end{array}$$

for *x*, *y* : Surreal inductive-inductively. (Size problems required modifications, see paper).

イロト 不得 トイヨト イヨト 二日

Example Surreal Numbers

Assume

$$X_{L}, X_{R} : \mathcal{P}(Surreal)$$

 $\forall x \in X_{L}. \forall y \in X_{R}. x \leq y$

Then

 $(X_{\rm L},X_{\rm R})$: Surreal

Assume

$$X = (X_{
m L}, X_{
m R})$$
 : Surreal $Y = (Y_{
m L}, Y_{
m R})$: Surreal

Assume

►
$$\forall x \in X_L. Y \leq x.$$

► $\forall y \in Y_R. y \leq X.$
Then $X \leq Y.$

Example Surreal Numbers

Assume

$$X = (X_{
m L}, X_{
m R})$$
 : Surreal $Y = (Y_{
m L}, Y_{
m R})$: Surreal

Assume

•
$$\exists x \in X_{\mathrm{L}}. Y \leq x$$
 or

►
$$\exists y \in Y_{\mathrm{R}}.y \leq X.$$

Then $X \not\leq Y$.

Coalgebras

Coalgebras

- Restriction to the simplest non-indexed case.
- Algebras are functions

$$f: F A \rightarrow A$$

Simplest example Lists:

$$[\operatorname{nil}, \operatorname{cons}] : (\{*\} + A \times \operatorname{List} A) \to \operatorname{List} A$$

• **Coalgebras** are functions

$$f: A \to F A$$

• Colists are sets coList A : Set together with

case : coList
$$A \rightarrow (\{*\} + A \times \text{List } A)$$

3

Misconception

Often people think colists consist of

```
\cos a_1 (\cos a_2 \cdots (\cos a_n \operatorname{nil}) \cdots)
```

or infinite streams

```
\cos a_1 (\cos a_2 \cdots)
```

- In our setting colists are not infinite, but can be unfolded potentially infinitely many.
- Example: the increasing colist is given by

```
inc : \mathbb{N} \to \text{coList}
case (inc n) = inr \langle n, \text{inc} (n+1) \rangle
```

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ●

Theory of Coalgebras

- ► Can be developed for indexed coalgebras with dependencies.
- Extensions to induction-recursion don't make sense yet.
- In type theory
 - ► Algebras are determined by their introduction rules, the elimination rules are "derived".
 - Coalgebras are determined by their elimination rules, the introduction rules are "derived".

イロト 不得 トイヨト イヨト 二日

- From algebra as in computer science to an abstract notion of algebras.
- Non-indexed, indexed inductive definitions.
- Induction recursion more symmetric.
- Induction induction seems to occur often in mathematics.
- ► Coalgebras as sets defined by their elimination rules.

イロト 不得 トイヨト イヨト 二日
